

Target-task sampler contract

identity and labelability are fixed before rollout labels and headroom are measured

Actor-visible proposal

$B_{\hat{e}}$
 $\varphi_{\hat{e}}$ + audit fields

Oracle assets

GT OBB set $\mathcal{E}$
target meshes for labels

Identity gate

$\mu_1 \geq \tau_{\text{IoU}}$
 $\mu_1 - \mu_2 \geq \tau_{\text{gap}}$

Deterministic cap

select from $\mathcal{E}_{\text{valid}}$
seeded uniform/stratified
keep unmatched reasons

Target-task row

e, φ_e , match record
source, support, distance

Rollout generation

finite $\mathcal{Q}_t$
masks + reasons

GT-EVAL labels

target crop
 $r_t^e, \Delta_{\text{look}}$

Actor input

target descriptor
no GT boxes

OBB match inset

B_{e_3}, μ_1
 B_{e_2}, μ_2
 $\hat{B}$
 $\mu_1 - \mu_2$ is the ambiguity gap

GT assets and labels are oracle-only; actor inputs keep target descriptors, not GT boxes
