

Implemented oracle target-task sampling

1 Enumerate GT OBB rows

stored rows from one snippet

row	stored geometry
✓ e_0	finite pose · positive extent
✗ e_1	padding row
✗ e_2	finite pose · zero extent
✓ e_3	finite pose · positive extent

2 Form the task pool

finite, non-padding, positive geometry

$\mathcal{E}_{\text{valid}} = \{e_0, e_3, \dots\}$
seeded uniform · no replacement
cap K from the run manifest

e_0
kept

e_3
kept

e_7
not drawn

admission is independent of headroom and expected gain

3 Create oracle task rows

GT identity; no proposal match

e, φ_e
identity · class
pose · extent
reference-relative geometry

Oracle evaluability
mesh crop + support
rendered evidence

Not used for target admission

actor proposal · proposal-GT IoU · ambiguity gap · visibility/support threshold · headroom threshold

These belong to a future actor-visible protocol or to later oracle diagnostics.
